

## VISTA LESSON 21

### HAVE I GOT A PASSWORD FOR YOU

Sometimes our password is the only thing standing between you and a computer meltdown. I've preached that your passwords should be at least 7 to 8 characters and should include a mixture of upper and lower case letters, as well as numbers and punctuation marks. The only problem is trying to remember all of that. It can sometimes be a problem.

Another workable password involves using phrases, like "boyismybossrotten" or "elvisisstilltheking." Using phrases increases the number of characters that protect you, and if you can put together a password phrase that also includes numbers and punctuation, and remember you can mix and match with upper and lower case letters.

Trust me. You'll feel much better when you know your computer is safe and secure.
